A circle is the set of points in a plane that are equidistant from a given point O. The distance r from the center is called the radius, and the point O is called the center. Twice the radius is known as the diameter $d=2r$. The angle a circle subtends from its center is a full angle, equal to 360 degrees or 2π radians. A circle has the maximum possible area for a given perimeter, and the ...

In this section we will discuss how to solve trig equations. The answers to the equations in this section will all be one of the "standard" angles that most students have memorized after a trig class. However, the process used here can be used for any answer regardless of it being one of the standard angles or not.

Apollonius' Problem. Given three objects, each of which may be a point, line, or circle, draw a circle that is tangent to each. There are a total of ten cases. The two easiest involve three points or three lines, and the hardest involves three circles.Euclid solved the two easiest cases in his Elements, and the others (with the exception of the three circle problem), appeared in the Tangencies ...

In mathematics, trigonometric identities are equalities that involve trigonometric functions and are true for every value of the occurring variables where both sides of the equality are defined. Geometrically, these are identities involving certain functions of one or more angles. They are distinct from triangle identities, which are identities potentially involving angles but also involving ...
