Coefficients also apply to a larger scale, in which the counting unit is the mole (there are 6.02×10^{23} molecules per mole of a compound), rather than individual molecules. Thus, this balanced equation also represents the reaction of six moles of glucose with six moles of water to produce one mole of glucose and six moles of oxygen.

The rate law or rate equation for a chemical reaction is an equation that links the reaction rate with the concentrations or pressures of the reactants and constant parameters (normally rate coefficients and partial reaction orders). For many reactions the rate is given by a power law such as $\text{rate} = k[A]^m[B]^n$ where $[A]$ and $[B]$ express the concentration of the species A and B (usually in moles per liter ...
