Colligative Properties Of Solutions Lab

measuring the freezing point depression of a solution of this solute in a solvent as compared to the freezing point of the pure solvent. Background: Colligative properties are properties of a solvent, such as freezing point depression and boiling point elevation, which depend on the concentration of solute particles dissolved in the solvent.

For a non-electrolyte such as antifreeze (ethylene glycol), the molality of particles in solution is a 1:1 proportion with the molality. In electrolytes such as sodium chloride, the molality of particles is equal to the molality of the electrolyte times the number of ions in the chemical formula of the compound.

Related Documents. First, colligative properties are "those of a solution that depend solely on the number of solute particles present, not the identity of those solute particles. These properties include: vapor pressure lowering, boiling point elevation, freezing point depression, and osmotic pressure" (p. 17 lab manual). In this....

Pre-Lab Discussion. The three colligative properties are boiling point, freezing point, and vapor pressure. They are called colligative properties because they are related to the number and energy of collisions between particles and not to what the particles are. Distinguish between volatile and nonvolatile substances.

Some colligative properties are vapor pressure lowering, boiling point elevation, freezing point depression and osmotic pressure. When a nonvolatile solute is added to a solvent, the vapor pressure of the solvent above the solution is less than the vapor pressure above the pure solvent as demonstrated in figure 1.
