Abiogenesis, or informally the origin of life, is the natural process by which life has arisen from non-living matter, such as simple organic compounds. While the details of this process are still unknown, the prevailing scientific hypothesis is that the transition from non-living to living entities was not a single event, but a gradual process of increasing complexity that involved molecular ...

Hypothetical types of biochemistry are forms of biochemistry speculated to be scientifically viable but not proven to exist at this time. The kinds of living organisms currently known on Earth all use carbon compounds for basic structural and metabolic functions, water as a solvent, and DNA or RNA to define and control their form. If life exists on other planets or moons, it may be chemically ...

She says that although doctors, the media, and society in general has latched on to the idea that

depression and anxiety, for example, are just evidence of a “chemical imbalance” in the brain, there is no hard evidence to support this. “Scientific research has not detected any reliable abnormalities of the serotonin system in people who are depressed.”

In a chemical reaction, one or more reactants are transformed into products: reactants → products. The purpose of a chemical equation is to express this relation in terms of the formulas of the actual reactants and products that define a particular chemical change. For example, the reaction of mercury with oxygen to produce mercuric oxide would be expressed by the equation
