where  $R_A$  and  $R_B$  are fouling resistance, which decreases the overall heat transfer coefficient, resulting in decreasing heat transfer efficiencies. The physical reason for a decrease in efficiency is because the thermal conductivity of the fouling layer is much less than that of the metal surface, and, also because of the additional length over which heat transfer must now take place ...

The concept of a fractal dimension rests in unconventional views of scaling and dimension. As Fig. 4 illustrates, traditional notions of geometry dictate that shapes scale predictably according to intuitive and familiar ideas about the space they are contained within, such that, for instance, measuring a line using first one measuring stick then another 1/3 its size, will give for the second ...

The scale of a map is the ratio of a distance on the map to the corresponding distance on the ground. This simple concept is complicated by the curvature of the Earth's surface, which forces scale to vary across a map. Because of this variation, the concept of scale becomes meaningful in two distinct ways.

The size of  $t$  is available to both the owner watermark and to the attacker. As long as  $t$  remains in the imperceptible region, there exists some  $t'$  use by the attacker where  $l' = v + t'$  and there is no perceptible difference between  $l$  and  $l'$ . This attack may be used to remove or replace the  $t$  region. A variation of this attack is explored in [CMYY97] to the aspect of counterfeiting watermarks.
