**Figure 1. Triglyceride Broken Down into a Monoglyceride** A triglyceride molecule (a) breaks down into a monoglyceride (b). Lipid metabolism begins in the intestine where ingested triglycerides are broken down into smaller chain fatty acids and subsequently into monoglyceride molecules (see Figure 1b) by pancreatic lipases, enzymes that break down fats after they are emulsified by bile salts.

### **24.3 Lipid Metabolism - Anatomy and Physiology**

3. What substance makes the stomach contents acidic? What substance protects stomach cells from the low pH of stomach contents? Hydrochloric acid produced by cells that line the stomach lowers the pH of the stomach contents to about 2. Mucus, also produced by stomach lining cells, protects these cells from the acid environment. 4.

Cancer is a group of diseases involving abnormal cell growth with the potential to invade or spread to other parts of the body. These contrast with benign tumors, which do not spread. Possible signs and symptoms include a lump, abnormal bleeding, prolonged cough, unexplained weight loss, and a

change in bowel movements. While these symptoms may indicate cancer, they can also have other causes.
