## **xkcd: Scientific Paper Graph Quality**

Since of the Earth's atmosphere is out-of-balance with the conditions expected from simple chemical equilibrium, it is very hard to say what precisely sets the level of the carbon dioxide content in the air throughout geologic time. While scientists are fairly certain that a 100 million years ago carbon dioxide values were many times higher than now, the exact value is in doubt.

Aha, you cracked it... Not. What you don't get is that as the feedback becomes greater the stability is lower. That is the system starts to oscillate, there is no evidence of any oscillation in heating, Conveniently, the climate scientists use a scalar model which ignores time lags and presumes you can superpose all the feedback.

### **The 800 year lag in CO<sub>2</sub> after temperature - graphed « JoNova**

Climate sensitivity can be calculated empirically by comparing past temperature change to natural forcings at the time. Various periods of Earth's past have been examined in this manner and find broad agreement of a climate sensitivity of around 3°C.

### **How sensitive is our climate? - skepticscience.com**

A large number of factors affect the consistency of a temperature record over time, meaning that raw temperature recordings are not always suitable for characterising long-term changes in our climate.
