Zn 4 O(BDC) 3, also called MOF-5, is a metal-organic framework in which 1,4-benzenedicarboxylate (BDC) anions bridge between cationic Zn 4 O clusters. The rigid framework contains large voids, represented by orange spheres. MOFs can be made from many different transition metal ions and bridging ligands, and are being developed for practical applications in storing gases, especially H 2 and CO 2.

The key to understanding acids (as well as bases and salts) had to await Michael Faraday's midnineteenth century discovery that solutions of salts (now known as electrolytes) conduct electricity. This implies the existence of charged particles that can migrate under the influence of an electric field.

The ions that we have discussed so far are called monatomic ions, that is, they are ions formed from only one atom. We also find many polyatomic ions. These ions, which act as discrete units, are electrically charged molecules (a group of bonded atoms with an overall charge).

Ascorbic acid is an organic compound with formula C 6 H 8 O 6, originally called hexuronic acid. It is a white solid, but impure samples can appear yellowish. It dissolves well in water to give mildly acidic solutions. It is a mild reducing agent. Ascorbic acid exists as two enantiomers (mirror-image isomers), commonly denoted "L" (for "levo") and "D" (for "dextro").
