Hamiltonian mechanics is a theory developed as a reformulation of classical mechanics and predicts the same outcomes as non-Hamiltonian classical mechanics. It uses a different mathematical formalism, providing a more abstract understanding of the theory. Historically, it was an important reformulation of classical mechanics, which later contributed to the formulation of statistical mechanics ...

There is a large variety of phenomena caused by the action of intense electric forces on capillary systems. These phenomena include transient, periodic, quasi-steady and steady flows resulting from the competition between the electric driving forces and the hydrodynamic ones, naturally arising when the liquid sets in motion.

Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this.
